

The Battle of Neighborhoods - Business Proposal

By Lorenzo Rappuoli

Introduction

This project analyze the different districts of Toronto based on the number of shootings, the population, the density and the average salary of its inhabitants.

The purpose of this study is to classify neighborhoods into homogeneous groups that indicate the risk of being injured or killed in a firefight.

This analysis could allow people interested in moving to Toronto to decide where to take home in order to protect their safety.

Aim of the project

The problem we want to solve is to allow a person who is looking for a home in Toronto to do so while avoiding the areas of greatest risk.

To do this, we want to divide the neighborhoods of Toronto into different risk groups: from the most dangerous to the quietest. These data can then be cross-referenced with house prices to make a more accurate choice.

Stakeholders

The possible stakeholders for this project are:

- People interested in moving to Toronto from another city/country and want to make a decision based on their safety
- The public administration of the city.
- The law enforcement agencies.
